

**Question 1.** — Evaluate the following limits.

$$\begin{array}{ll} \text{a. } \lim_{x \rightarrow 2^-} \frac{2x^3 - 4x^2}{3x^2 - 8x + 4} & \text{b. } \lim_{x \rightarrow 0} \frac{\sin^2(3x)}{5x \sin(2x)} \\ \text{c. } \lim_{x \rightarrow -\infty} \frac{\sqrt{4x^6 + 3x^5}}{2x^3 + \sqrt{9x^6 + 7x^5}} & \text{d. } \lim_{x \rightarrow 2^+} \frac{\sqrt{x-2} - x + 2}{6 - 3x} \end{array}$$

**Question 2.** — Let

$$f(x) = \begin{cases} x^2 - k - 3 & \text{if } x < -1, \\ k + 4 & \text{if } x = -1 \text{ and} \\ k^2 + 4x - 4 & \text{if } x > -1. \end{cases}$$

Find all values of  $k$  such that:

- a.  $\lim_{x \rightarrow -1} f(x)$  is defined;                      b.  $f$  is continuous on  $\mathbb{R}$ .

**Question 3.** — Use the limit definition of the derivative to find  $f'(x)$ , where

$$f(x) = \frac{1}{3 - 2x}.$$

**Question 4.** — Find  $\frac{dy}{dx}$  for each of the following. Do not simplify your answers.

$$\begin{array}{ll} \text{a. } y = 16\sqrt[4]{x} + e^x - x^e + \frac{\pi}{x} & \text{b. } y = \frac{(8 - 5x^2)^4}{\tan(7x) - 9} \\ \text{c. } y = e^{\sqrt{2x^3}} & \text{d. } y = (\sin x)^{4 \ln x} \end{array}$$

**Question 5.** — Write an equation of the line tangent to the curve defined by

$$x^2 y + \sin(y) + \frac{4}{\pi} y = 3e^x$$

at the point  $(0, \frac{1}{2}\pi)$ .

**Question 6.** — Let  $\vartheta$  be the radian measure of an acute angle in a right-angled triangle and let  $x$  and  $y$  be, respectively, the lengths of the sides adjacent and opposite to  $\vartheta$ . Suppose also that  $x$  and  $y$  vary with time. At a certain instant,  $x = 4$  cm and is increasing at 8 cm/s, while  $y = 3$  cm and is decreasing at 2 cm/s. At what rate is  $\vartheta$  changing at that instant?

**Question 7.** — A box with a square base and open top needs to be made. The material for the base of the box costs \$10 per square metre, while the material for the sides costs \$5 per square metre. Using only \$120, what are the dimensions of such a box with largest volume?

**Question 8.** — Find the absolute extrema of  $f(x) = \frac{x}{2} + \frac{2}{x^2}$  on  $[1, 4]$ .

**Question 9.** — The linear position of a particle is given by  $s = t^3 - 3t^2$ , where  $s$  is measured in metres and  $t \geq 0$  is measured in seconds.

- a. Find the velocity function of the particle.  
b. At what times is the particle at rest?  
c. When is the particle moving in the positive direction?

**Question 10.** — Sketch the graph of  $f(x) = \frac{x+2}{\sqrt{x^2+2}}$ , given that

$$f'(x) = \frac{2(1-x)}{(x^2+2)^{3/2}} \quad \text{and} \quad f''(x) = \frac{2(x-2)(2x+1)}{(x^2+2)^{5/2}}.$$

Make sure that your solution includes all intercepts, asymptotes, intervals of monotonicity, intervals of concavity, local extrema and points of inflection.

**Question 11.** — Evaluate each of the following integrals.

$$\begin{array}{ll} \text{a. } \int \left( \frac{2}{x} - \sqrt[3]{x^5} + 7e^x \right) dx & \text{b. } \int \frac{(5x-3)^2}{x} dx \\ \text{c. } \int \frac{1 - \sin(\vartheta)}{\cos^2(\vartheta)} d\vartheta & \text{d. } \int_2^3 \frac{x^2 + 8x + 15}{x+3} dx \end{array}$$

**Question 12.** — Given  $f(x) = \int_6^{1/x} \frac{t}{\sqrt{1+t}} dt$ , find  $f(1/6)$  and  $f'(x)$ .

**Question 13.** — Express

$$\int_0^5 \sin(x^2) dx$$

as a limit of Riemann sums. Do not evaluate the limit.

**Question 14.** — Decide whether or not the equality below is correct. Justify your answer.

$$\int \log(x) dx = x \log(x) - x.$$

**Solution to Question 1.** — a. Factorizing gives

$$\lim_{x \rightarrow 2^-} \frac{2x^2(x-2)}{(x-2)(3x-2)} = \frac{8}{4} = 2.$$

b. Revising the expression gives

$$\lim_{x \rightarrow 0} \left\{ \left( \frac{\sin 3x}{3x} \right)^2 \cdot \frac{2x}{\sin(2x)} \cdot \frac{3^2}{2 \cdot 5} \right\} = \frac{9}{10}.$$

c. Inspecting dominant terms gives (recall that  $\sqrt{x^6} = -x^3$  if  $x < 0$ )

$$\lim_{x \rightarrow -\infty} \frac{\sqrt{4x^6 + 3x^5}}{2x^3 + \sqrt{9x^6 + 7x^5}} = \frac{-\sqrt{4}}{2 - \sqrt{9}} = 2.$$

d. Factorizing gives

$$\lim_{x \rightarrow 2^+} \frac{\sqrt{x-2}(1-\sqrt{x-2})}{-3(x-2)} = \lim_{x \rightarrow 2^+} \frac{1-\sqrt{x-2}}{-3\sqrt{x-2}} = -\infty,$$

since  $1 - \sqrt{x-2} \rightarrow 1$  and  $-3\sqrt{x-2} \rightarrow 0^-$  as  $x \rightarrow 2^+$ .

**Solution to Question 2.** — Since

$$\lim_{x \rightarrow -1^-} f(x) = -k - 2, \quad f(-1) = k + 4 \quad \text{and} \quad \lim_{x \rightarrow -1^+} f(x) = k^2 - 8,$$

it follows that  $\lim_{x \rightarrow -1} f(x)$  is defined if, and only if,

$$k^2 - 8 = -k - 2, \quad \text{or} \quad 0 = k^2 + k - 6 = (k+3)(k-2),$$

i.e.,  $k = -3, 2$ .

The function  $f$  is everywhere continuous if, in addition,  $k + 4 = -k - 2$ , or  $k = -3$ .

**Solution to Question 3.** — If  $y = 1/(3-2x)$  then  $y' = 1/(3-2x')$  and

$$y' - y = \frac{3-2x-(3-2x')}{(3-2x')(3-2x)} = \frac{2(x'-x)}{(3-2x')(3-2x)},$$

so

$$f'(x) = \lim_{x' \rightarrow x} \frac{y' - y}{x' - x} = \lim_{x' \rightarrow x} \frac{2}{(3-2x')(3-2x)} = \frac{2}{(3-2x)^2}.$$

**Solution to Question 4.** — a. If  $y = 16\sqrt[4]{x} + e^x - x^e + \frac{\pi}{x}$ , then

$$\frac{dy}{dx} = 4x^{-3/4} + e^x - ex^{e-1} - \pi/x^2.$$

b. If  $y = \frac{(8-5x^2)^4}{\tan(7x)-9}$ , then

$$\frac{dy}{dx} = \frac{-40x(8-5x)^3}{\tan(7x)-9} - \frac{7(8-5x^2)^4 \sec^2(7x)}{(\tan(7x)-9)^2}.$$

c. If  $y = e^{\sqrt{2x^3}}$ , then  $\frac{dy}{dx} = \frac{3}{2}\sqrt{2x}e^{\sqrt{2x^3}}$ .

d. If  $y = (\sin x)^{4 \ln x}$ , then

$$\frac{dy}{dx} = y \frac{d}{dx} (\log y) = 4(\sin x)^{4 \ln x} \left\{ \frac{\log(\sin x)}{x} + \cot(x) \log(x) \right\}.$$

**Solution to Question 5.** — The slope of the tangent line to the curve defined by  $x^2 y + \sin(y) + \frac{4}{\pi} y - 3e^x = 0$  is

$$\left. \frac{dy}{dx} \right|_{\substack{x=0 \\ y=\frac{1}{2}\pi}} = - \left. \frac{2xy - 3e^x}{x^2 + \cos(y) + 4/\pi} \right|_{\substack{x=0 \\ y=\frac{1}{2}\pi}} = \frac{3}{4}\pi,$$

so the tangent line is defined by  $y = \frac{3}{4}x + \frac{1}{2}\pi$ .

**Solution to Question 6.** — Since  $\tan(\vartheta) = y/x$ , differentiating with respect to time gives

$$(1 + \tan^2(\vartheta)) \frac{d\vartheta}{dt} = \frac{1}{x} \frac{dy}{dt} - \frac{y}{x^2} \frac{dx}{dt}.$$

If  $x = 4$  and  $y = 3$  then  $1 + \tan^2(\vartheta) = 1 + \left(\frac{3}{4}\right)^2 = \frac{25}{16}$ , so at the given instant

$$\frac{d\vartheta}{dt} = \frac{16}{25} \left( \frac{1}{4} \cdot (-2) - \frac{3}{16} \cdot 8 \right) = -\frac{32}{25}.$$

Therefore, at the instant in question,  $\vartheta$  is decreasing at a rate of  $\frac{32}{25}$  radians per second.

**Solution to Question 7.** — If  $x$  denotes the side of the base of the box and  $y$  its height, then  $120 = 10x^2 + 20xy$ , so  $y = 6/x - x/2$ , and the volume of the box is  $V = x^2 y = 6x - \frac{1}{2}x^3$ . Then

$$\frac{dV}{dx} = 6 - \frac{3}{2}x^2 = \frac{3}{2}(4 - x^2),$$

which is positive if  $0 < x < 2$  and negative if  $2 < x < 2\sqrt{3}$  (beyond which  $y$  is negative), so  $V$  is maximized if  $x = 2$  and  $y = 6/2 - 2/2 = 2$ . Hence, the largest such box is a cube with side 2 metres.

**Solution to Question 8.** — The derivative of  $f$  is

$$f'(x) = \frac{1}{2} - \frac{4}{x^3} = \frac{8 - x^2}{2x^3},$$

so the only critical number of  $f$  is 2. Comparing

$$f(1) = \frac{1}{2} + 2 = \frac{5}{2}, \quad f(2) = 1 + \frac{1}{2} = \frac{3}{2} \quad \text{and} \quad f(4) = 2 + \frac{1}{8} = \frac{17}{8},$$

reveals that the largest value of  $f$  on  $[1, 4]$  is  $\frac{5}{2}$  and the smallest value is  $\frac{3}{2}$ .

**Solution to Question 9.** — The velocity of the particle is

$$\frac{ds}{dt} = 3t^2 - 6t = 3t(t-2),$$

so the particle is at rest when  $t = 0, 2$  and the particle moves in the positive direction when  $t > 2$ .

**Solution to Question 10.** — The domain of  $f$  is  $\mathbb{R}$ , the intercepts are  $(0, \sqrt{2})$  and  $(-2, 0)$ , the graph has no vertical asymptotes, and the horizontal asymptotes are defined by  $y = \pm 1$ , since

$$\lim_{x \rightarrow \pm\infty} \frac{x+2}{\sqrt{x^2+2}} = \pm 1,$$

as is seen by inspecting the dominant terms. The first derivative is positive if  $x < 1$  and negative if  $x > 1$ , so  $f$  is increasing on the interval  $(-\infty, 1]$ , decreasing on the interval  $[1, \infty)$ , with a local (and global, as it turns out) maximum at  $(1, \sqrt{3})$ . The second derivative is positive if  $x < -\frac{1}{2}$  or  $x > 2$  and negative if  $-\frac{1}{2} < x < 2$ , so the graph is concave up on the intervals  $(-\infty, -\frac{1}{2}]$  and  $[2, \infty)$ , concave down on the interval  $[-\frac{1}{2}, 2]$  with points of inflection  $(-\frac{1}{2}, 1)$  and  $(2, \frac{2}{3}\sqrt{6})$ . Below is a sketch of the graph of  $f$ , with the horizontal asymptotes drawn as dashed lines and the points of interest emphasized.

**Solution to Question 11.** — a. Integrating by inspection gives

$$\int \left( \frac{2}{x} - \sqrt[3]{x^5} + 7e^x \right) dx = 2 \log|x| - \frac{3}{8}x^{8/3} + 7e^x.$$

b. Expanding, dividing and integrating by inspection gives

$$\int \frac{(5x-3)^2}{x} dx = \int \left( 25x - 30 + \frac{9}{x} \right) dx = \frac{25}{2}x^2 - 30x + 9 \log|x|.$$

c. Dividing and integrating by inspection gives

$$\int \frac{1 - \sin(\vartheta)}{\cos^2(\vartheta)} d\vartheta = \int \left( \frac{1}{\cos^2(\vartheta)} - \frac{\sin(\vartheta)}{\cos^2(\vartheta)} \right) d\vartheta = \tan(\vartheta) - \frac{1}{\cos(\vartheta)}.$$

d. Since  $x^2 + 8x + 15 = (x+3)(x+5)$ , it follows that

$$\int_2^3 \frac{x^2 + 8x + 15}{x+3} dx = \int_2^3 (x+5) dx = \frac{1}{2}(x+5)^2 \Big|_2^3 = \frac{1}{2}(64 - 49) = \frac{15}{2}.$$

**Solution to Question 12.** — Interval additivity and Barrow's theorem give

$$f(1/6) = \int_6^6 \frac{t}{\sqrt{1+t}} dt = 0$$

and

$$f'(x) = \frac{1/x}{\sqrt{1+1/x}} \cdot \frac{-1}{x^2} = \frac{-1}{x^3 \sqrt{1+1/x}}.$$

**Solution to Question 13.** — If the interval  $[0, 5]$  is divided into  $k$  subintervals of equal length, then the length of each subinterval is  $\frac{5}{k}$  and the endpoints of the subintervals are  $\frac{5}{k}j$ , for  $j = 0, 1, 2, 3, \dots, k$ . If right endpoints are

marked for evaluation, then

$$\int_0^5 \sin(x^2) dx = \lim_{k \rightarrow \infty} \frac{5}{k} \sum_{j=1}^k \sin\left(\frac{25j^2}{k^2}\right).$$

**Solution to Question 14.** — Since

$$\frac{d}{dx}(x \log(x) - x) = \log(x) + x \cdot 1/x - 1 = \log(x),$$

it follows that the equation  $\int \log(x) dx = x \log(x) - x$  is correct.

---
